

BIOGRAPHICAL SKETCH

Provide the following information for the Senior/key personnel and other significant contributors.
Follow this format for each person. DO NOT EXCEED FIVE PAGES.

NAME: David H. Abbott

eRA COMMONS USER NAME (credential, e.g., agency login): davidabbott1

POSITION TITLE: Professor

EDUCATION/TRAINING (*Begin with baccalaureate or other initial professional education, such as nursing, include postdoctoral training and residency training if applicable. Add/delete rows as necessary.*)

INSTITUTION AND LOCATION	DEGREE (if applicable)	Completion Date MM/YYYY	FIELD OF STUDY
University of Edinburgh, Scotland	B.Sc.	1975	Biological Sciences
University of Edinburgh, Scotland	Ph.D.	1979	Zoology
University of Wisconsin, Madison, Wisconsin	Postdoc	1979-81	Repro. Physiology

A. Personal Statement

I would be delighted to serve as a Co-Investigator (Co-I). As a result of long-standing and highly productive collaboration with multiple investigators, including Drs. Levine (PI), my lab has developed a comprehensive nonhuman primate model for polycystic ovary syndrome (PCOS), the prenatally androgenized (PA) monkey, that has been the vanguard for a multitude of animal and human studies aimed at determining developmental origins of PCOS in women. NIH training program support of succeeding MD fellows in my laboratory has established pancreatic dysfunction as key additional component in our research arsenal and new collaborative links. Our most recent work identifies metabolic dysfunction as a key initial abnormality in early developmental origins of PCOS-like traits and shows aberrations at metabolomic and epigenetic, as well as endocrinological levels, including resistance to estradiol- and progesterone-mediated action at the hypothalamic-pituitary level (currently funded as sub-projects within P50 SCOR and U54 Center grants). The overall goal of our research is to investigate the cellular and molecular mechanisms that mediate the actions of androgens and estrogens in the primate brain, ovaries, pancreas and adipose depots. In addition, I bring to this effort over 30 years of experience employing animal models of female reproductive endocrinology to determine pathophysiological mechanisms underlying a variety of reproductive and metabolic health disorders commonly found in women, including neuroendocrine mechanisms regulating female reproduction. My lab has developed a suite of expertise for utilizing both rhesus and marmoset monkeys, including aspects of PCOS (rhesus monkeys), as well as post-traumatic stress disorder (PTSD), maternal neglect and abuse of infants, neuroendocrine regulation of ovulatory function, and gonadal regulation of adrenocortical steroidogenic function (marmoset monkeys). Together with Assay and Pathology Services, joint WNPRC and Institute of Clinical and Translational Research (CTSA-based) resources, our validated and published techniques and endocrine challenges bring neuroendocrine, ovarian/adrenal, steroid hormone and neural/body imaging approaches to investigation of mechanisms regulating reproductive and metabolic function. We have well-established, characterized and tractable colonies of rhesus and marmoset monkeys at WNPRC nicely adapted to biomedical procedures, and supported by animal and veterinary staff steeped in species-specific expertise. As a Senior Scientist at the Wisconsin National Primate Research Center (WNPRC), I enable preferential access for Dr. Levine to a network of my collaborators across campus, the US and internationally.

B. Positions and Honors

Positions and Employment

1981-1984	Research Associate, Department of Anatomy, University of Cambridge, England.
1984-1990	Research Fellow and Unit Head, Institute of Zoology, MRC/AFRC Comparative Physiology Research Group, Zoological Society of London, England.
1990-	University of Wisconsin - Madison, Wisconsin, USA.
1990-1992	Visiting Associate Professor, Department of Obstetrics and Gynecology and Wisconsin National Primate Research Center
1990-1999	Chair, Physiological Ethology Research Group, Wisconsin National Primate Research Center
1991-	Faculty Member, Wisconsin National Primate Research Center
1992-1998	Associate Professor, Department of Obstetrics and Gynecology and Wisconsin National Primate Research Center
1993-	Faculty Member, Endocrinology/Reproductive Physiology Training Program
1998-	Professor, Department of Obstetrics and Gynecology and Wisconsin National Primate Research Center

Other Experience and Professional Memberships

1995-	Editorial Board, Psychoneuroendocrinology
2003-2008	External Advisory Board, European Union Consortium investigating fetal programming of metabolic, endocrinological, behavioral and neural function
2006-	Editorial Board, Neuroendocrinology
2007-	Ad hoc Member, NIH IPOD, ICER and ad hoc Study Sections
2008-	Editorial Board, Int. J of Obesity
2009-	Board, AE-PCOS Society
2014-	Annual Meeting Steering Committee, Endocrine Society

Honors

1990	Co-recipient, Laurent-Perrier Champagne Award for Wild Game Conservation
2012-2015	President-Elect AE-PCOS Society (2012-13), President (2013-14), Past President (2014-15)

C. Contribution to Science (146 peer-reviewed publications, **h-index = 44**. In last 3 years, 5-8 publications/year; cited over 400 times/year).

1. My lab, concurrently with that of Barry Keverne, ScD FRS FMedSci (University of Cambridge), was the first to publish on social dominance-mediated suppression of female primate reproduction. I then led several teams to undertake a systematic and comparative approaches to determining neuroendocrine mechanisms mediating anovulation in socially subordinate females by studying, for the most part, two mammalian species that exhibit this trait to an extreme degree, the common marmoset (*Callithrix jacchus*), an arboreal, anthropoid primate from northeastern Brazil and the naked mole-rat (*Heterocephalus glaber*), a subterranean, caviomorph rodent from East Africa. We found surprising similarities in rank-related infertility among subordinate females of both species, even though these species are well separated by phylogeny, ecology and geography. We demonstrated that social status almost completely determines ovarian function: a single dominant female ovulates and produced offspring, while most, if not all, subordinates are anovulatory. We implicated inhibited

hypothalamic secretion of gonadotropin releasing-hormone (GnRH) as the probable cause of hypogonadotropic anovulation from social and neuroendocrine manipulations of female subordinates. At least for naked mole-rats, we confirmed hypogonadotropic anovulation as a naturally-occurring condition, from our field studies of free-living colonies in Kenya. We considered that dominance-driven harassment of subordinates exploits generalized inhibitory reproductive responses that most vertebrate species show to chronic physiological stress. This pivotal concept, however, was to undergo a drastic re-evaluation following my move to the University of Wisconsin-Madison. There results with marmosets consistently suggested involvement of specific, and perhaps novel, neuroendocrine mechanisms in social suppression of ovulation and not generalized stress. Experimental behavioral studies demonstrated that a majority of female marmosets do not even contest for dominance status. In established social groups, overt harassment of subordinate female marmosets and elevations in circulating cortisol and adrenocorticotropin (ACTH) concentrations were not found. Circulating cortisol levels were, in fact, suppressed. Studies employing discrete ablations of olfactory epithelia and detailed chemical analyses of individual female scent suggested that associative learning of olfactory (and visual) cues from a subordinate female's specific dominant female provided psychological conditioning of the neural mechanisms inhibiting gonadotropin secretion. Direct hypothalamic measurement of GnRH, from development of a push-pull perfusion system, provided no evidence of reduced or disrupted GnRH release from the hypothalamus in anovulatory subordinates and, instead, suggested that disruption or inhibition of GnRH-induced gonadotropin secretion from the pituitary formed the basis of socially-induced hypogonadotropic anovulation. Taken together, these developments suggested that subordinate status in marmoset monkeys is a stable physiological and behavioral alternative to dominant status and does not engender physiological stress. Subordinate females are, however, exquisitely sensitive to changes in their social environment and can rapidly engage ovulatory function in the absence of higher-ranking females. Such results are consistent with current reproductive skew theory prediction that a large proportion of female marmosets (and naked mole-rats) opt to curtail reproduction until conditions favorable for reproduction prevail (dominance status and presence of subordinates to raise offspring).

2. Between 1997 and 2005, together with my clinical colleague Daniel Dumesic, MD (University of California, Los Angeles, CA), I initiated the breakthrough experiments in nonhuman primates to identify fetal origins of polycystic ovary syndrome (PCOS), a familial infertility disorder affecting ~15% of women with accompanying 50-80% obesity, double the risk of type 2 diabetes and a tripled risk of gestational diabetes. The work was heralded as groundbreaking translational research, nationally and internationally, as exemplified by clinical research leaders in the field, Andrea Dunaif, MD (Northwestern University, Chicago, IL), Jeffrey Chang, MD (University of California, San Diego, CA), Richard Legro, MD (Penn State College of Medicine, Hershey, PA) and Stephen Franks, MD (Imperial College London, UK) stating "the insight that prenatal exposure to androgens can reproduce most of the features of the human syndrome in primates has led to a paradigm shift in concepts about the pathogenesis of the disorder" [1]. I have attracted multiple NIH grants in support of the collaborative, team-science approach needed to address this multi-faceted translational effort, including R01, R21 and U01 grants, as well as subprojects in P50 (Northwestern University), U54 (now P50s, University of Virginia and Oregon Health Sciences University) and P51 (Wisconsin National Primate Research Center) grants totaling \$5.9 million in direct costs (3 are still active). We now focus on molecular mechanisms in our monkey models related to gene candidates for PCOS, including a population of naturally occurring hyperandrogenic female monkeys.

Complete List of Peer-Reviewed Published Work in

PubMed: <http://www.ncbi.nlm.nih.gov/pubmed/?term=abbott+dh>

D. Research Support

Ongoing Research Support

P51 OD011106-53 (PI: MR Mailick) 07/02/13 – 04/30/17 1.20 calendar
 NIH/OD Yr 53 Direct: \$7,098,330

Wisconsin National Primate Research Center

Dr. Abbott forms part of the Behavioral Enrichment Unit.

Role: Co-I

P50 HD044405-12 (PI: A Dunaif) 07/01/13 – 06/30/17 1.80 calendar
 NIH/NICHD \$231,473

Genes, androgens and intrauterine environment in PCOS

In Subproject #3 in this competitive renewal, Dr. Abbott will be collaborating with Dr. Jon Levine (Subproject PI and Associate Director of the P50) to investigate the contribution of hypothalamic estrogen resistance in the pathogenesis of obesity, insulin resistance and PCOS in marmoset monkeys, a new nonhuman primate model for PCOS in humans.

Role: Co-I, Subproject III

P50 HD028934-21 (PI: JC Marshall) 04/01/14 – 03/31/19 1.50 calendar
 NIH/NICHD \$231,712

Clinical and Basic Studies in Polycystic Ovarian Syndrome (RFA-HD-14-017)

Project II: Hypothalamic Steroid Receptors and the Pathogenesis of PCOS

Studies related to this project will make use of viral vector-mediated gene silencing and a validated nonhuman primate model of androgen induced reproductive PCOS phenotypes to address these major gaps in our understanding of the mechanisms that mediate the pathogenesis of PCOS.

Role: Co-I, Project II

T32 HD041921-11 (PI: IM Bird) 05/01/14 – 04/30/19
 NIH/NICHD \$172,704

Endocrinology-Reproductive Physiology Training Grant

Dr. Abbott is one of the faculty mentors and he lectures in ERP courses. He currently mentors two students (B. Hutcherson for MS [04-present, minority]; M. Kraynak for PhD [13-present]).

Role: Trainer

T32 DK077586-06A1 (PI: MJ MacDonald)

06/01/14 – 05/31/19

NIH/NIDDK

\$118,290

Childhood Diabetes Clinical & Molecular Research Training Program (CDCMRT)

Dr. Abbott is one of the research trainers. He has successfully mentored two fellows (L. Nicol, MD, 2007-2010; K. Henrichs, MD, 2011-2014) through to faculty appointments.

Role: Trainer

Completed Research Support

3P51 RR000167-48S1 (PI: M Cadwallader)

10/01/09-04/30/12

NIH/NCRR

Revision Award: Determining PCOS-like traits in macaques and newborn human infants.

This competitive supplement is to characterize naturally occurring PCOS in monkeys and a newborn biomarker for PCOS in humans. Dr. Abbott leads this effort.

Role: **Named Co-I**

No agency number available (PI: **DH Abbott**)

11/1/09-12/31/12

Viamet Pharmaceuticals

Identification of novel inhibitors of gonadal and adrenal steroid production in macaque monkeys.

The goals of this project are to identify mechanisms of action of various androgen biosynthesis inhibitors.

Role: PI
